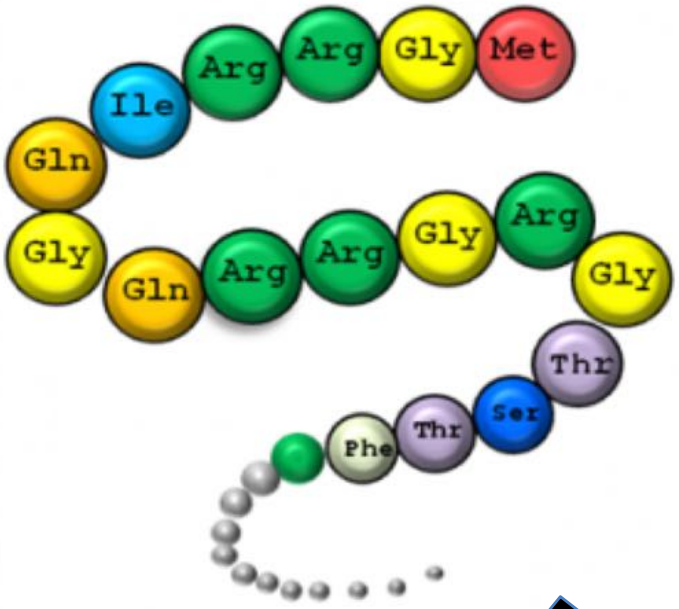
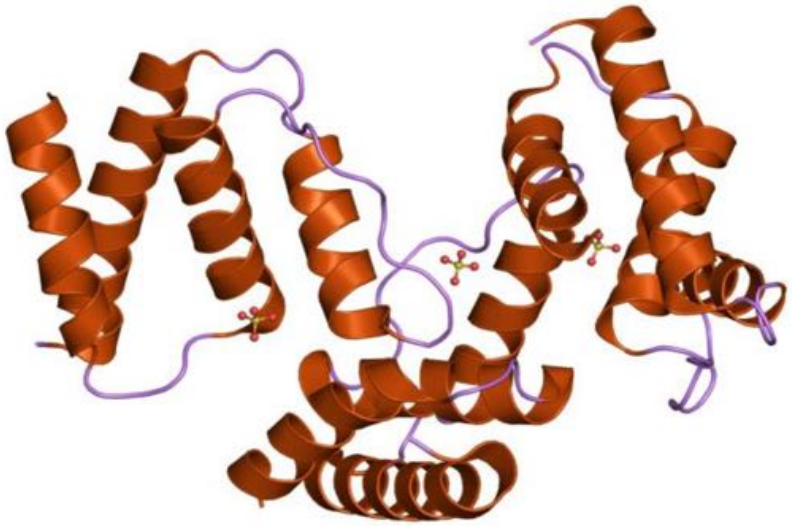
PROTEIN STRUCTURE PREDICTION

Amino Acid Sequence

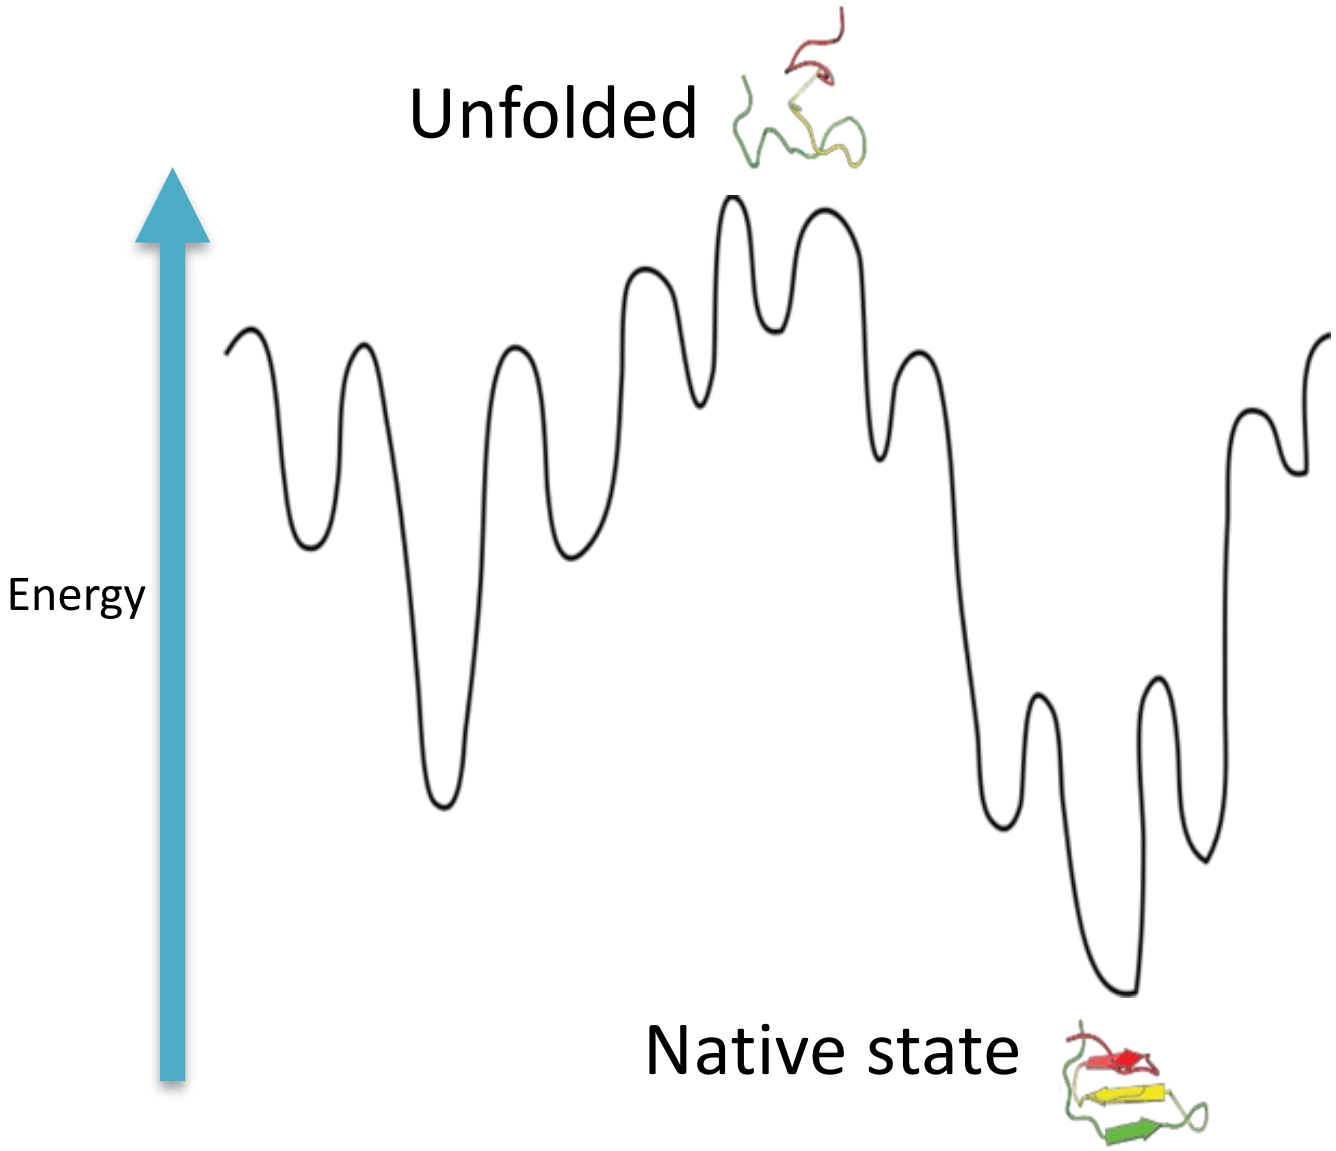




Protein Tertiary Structure

PROTEIN DESIGN

The folded states of proteins are likely global energy minima for their sequences



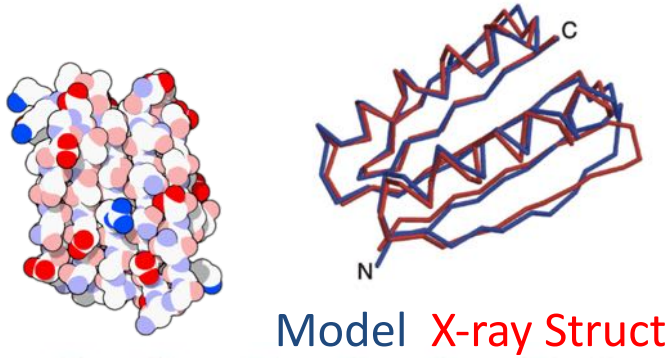
Protein Structure Prediction: find lowest energy structure for fixed sequence

Protein Design: find a sequence for which desired structure has lowest energy

Sample structures and sequences, and evaluate energies using **Rosetta molecular modeling suite**

15 Years Ago (2003): First *De Novo* Design

- First computational de novo design of a novel protein fold (Top 7) with atomic level accuracy.



Model X-ray Structure

RESEARCH ARTICLES

Design of a Novel Globular Protein Fold with Atomic-Level Accuracy

Brian Kuhlman,[1*†] Gautam Dantas,[1*] Gregory C. Ireton,[4] Gabriele Varani,[1,2] Barry L. Stoddard,[4] David Baker[1,3‡]

A major challenge of computational protein design is the creation of novel proteins with arbitrarily chosen three-dimensional structures. Here, we used a general computational strategy that iterates between sequence design and structure prediction to design a 93-residue α/β protein called Top7 with a novel sequence and topology. Top7 was found experimentally to be folded and extremely stable, and the x-ray crystal structure of Top7 is similar (root mean square deviation equals 1.2 angstroms) to the design model. The ability to design a new protein fold makes possible the exploration of the large regions of the protein universe not yet observed in nature.

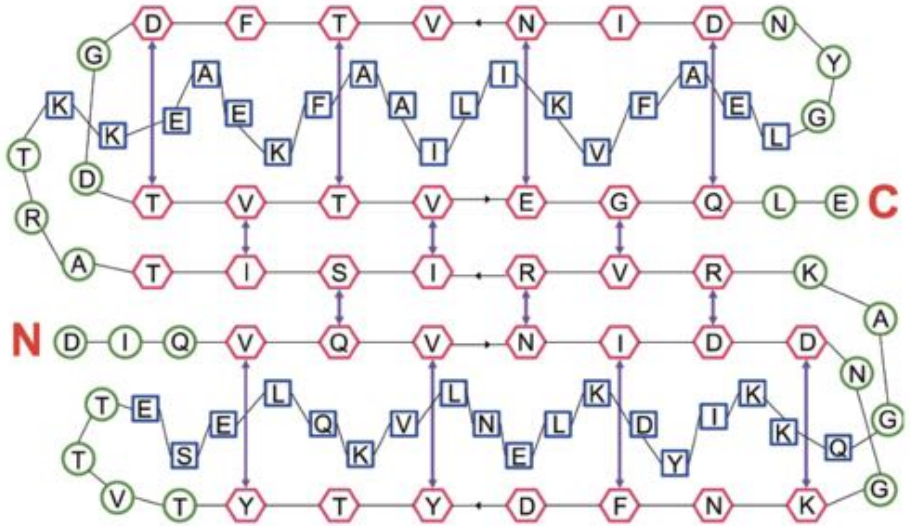


Fig. 1. A two-dimensional schematic of the target fold (hexagon, strand; square, helix; circle, other). Hydrogen bond partners are shown as purple arrows. The amino acids shown are those in the final designed (Top7) sequence.

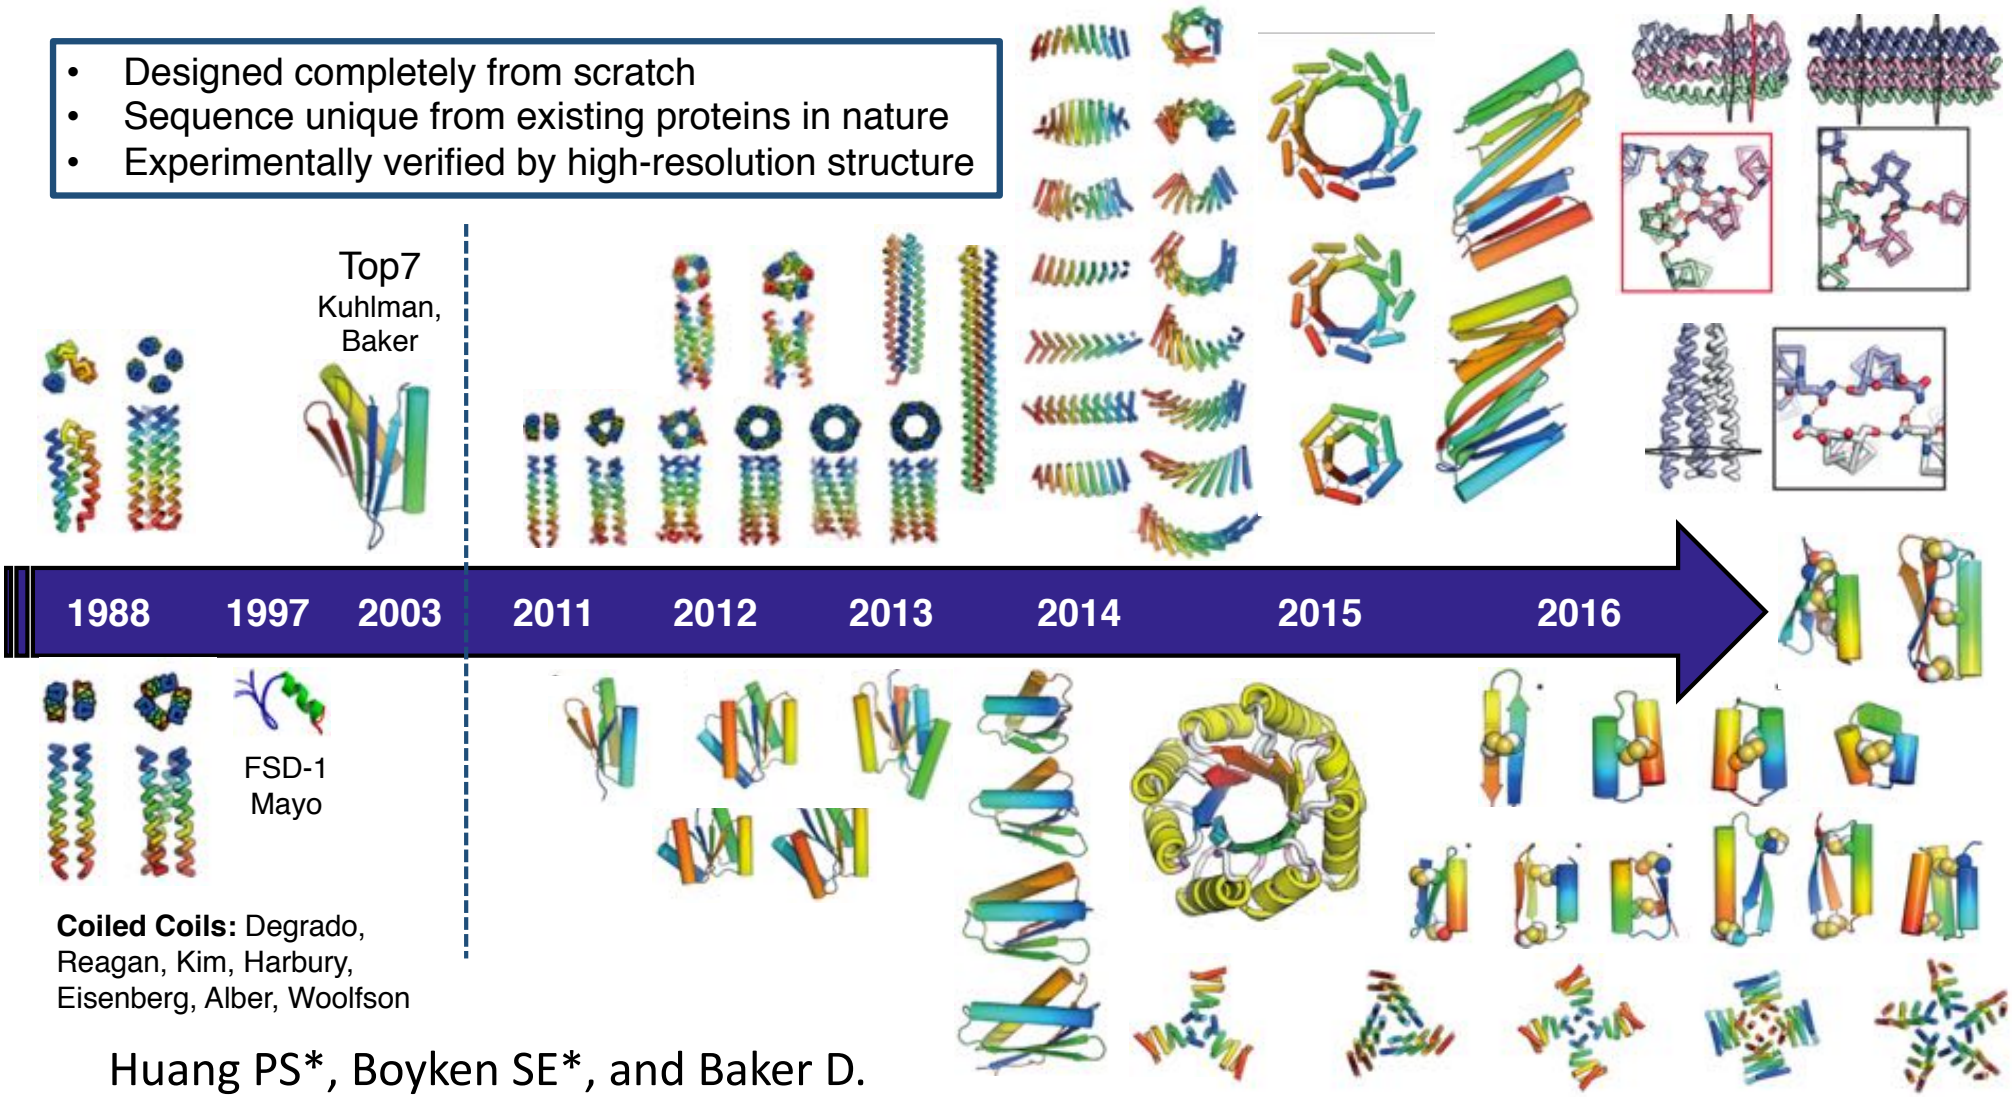
Kuhlman et al, *Science* 2003

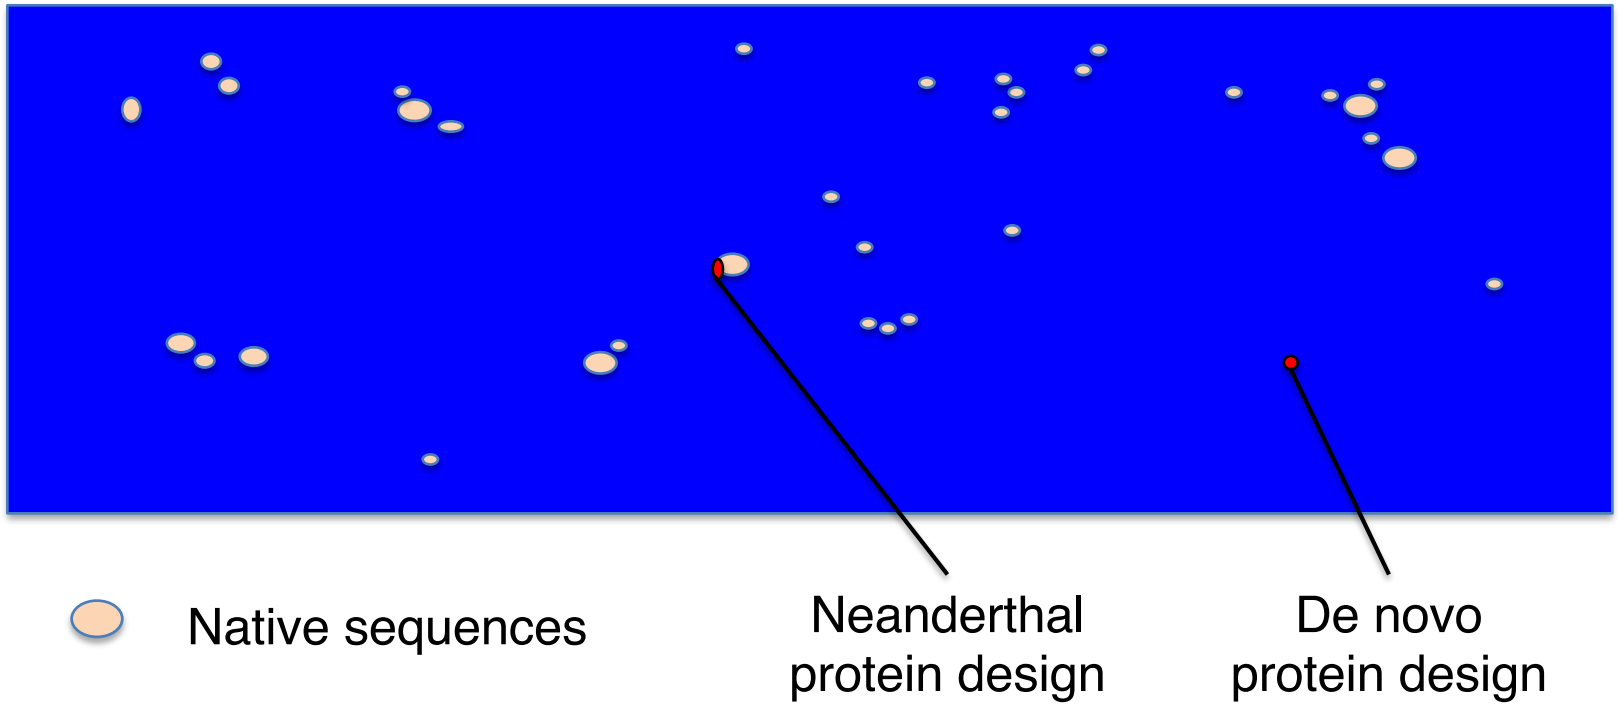
Today: The Coming of Age of *De Novo* Protein Design

- Designed completely from scratch
- Sequence unique from existing proteins in nature
- Experimentally verified by high-resolution structure



Huang PS*, Boyken SE*, and Baker D.
Nature 2016

De novo protein design



Number of 100 residue amino sequences: 20^{100} = **$1.3*10^{130}$**

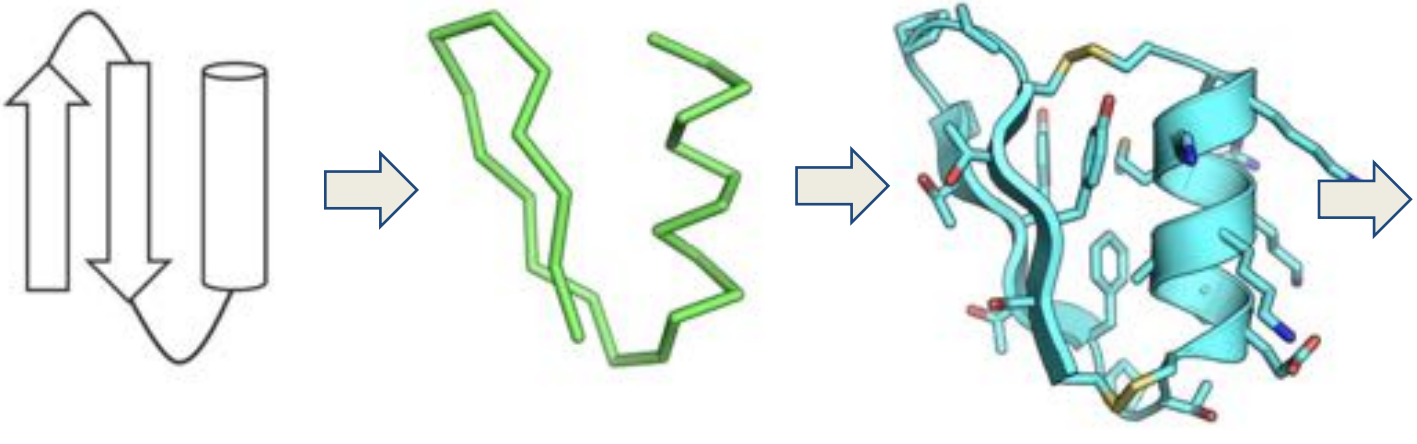
Number of naturally occurring proteins: **~10^{15}**

HISTORIC MOMENT IN PROTEIN DESIGN

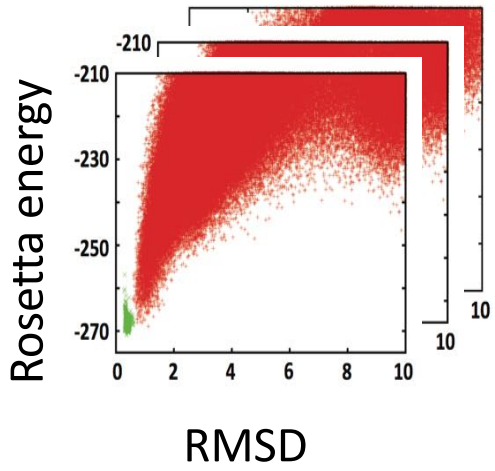
- We've learned how to design proteins from scratch.
- There is finally enough computing power to do it.
- Genomics enables building and testing designs in the lab.

De novo protein design method

Define Blueprint	Design Strain-Free Backbones	Design a Low Energy Sequences for Backbones	Select Sequences that Fold into Designed Structure

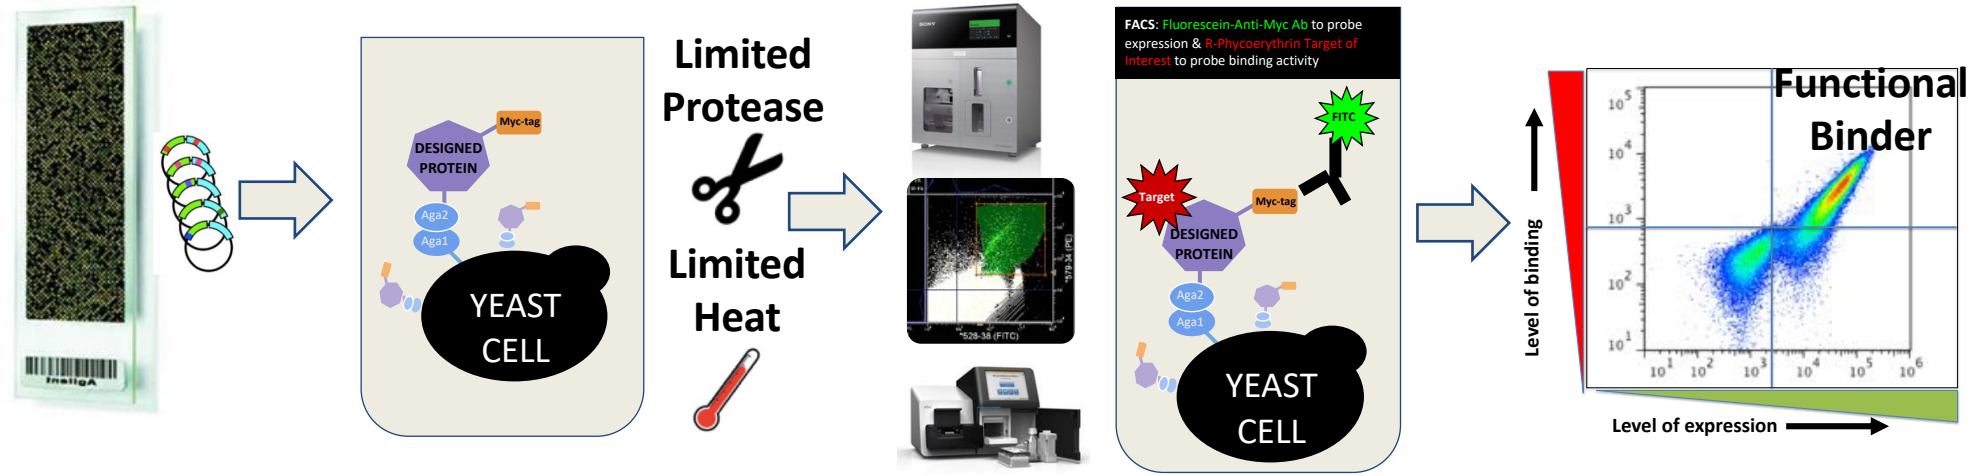


Size and arrangement of secondary structures	Backbones sampled using fragments of natural proteins	VERY LARGE number of possible amino acid sequences	Selection of designed sequences with lowest energies close to design model



De novo protein design method

Gene Library Synthesis	Generate Yeast Surface Display Libraries	FACS and Next-Gen DNA Sequencing	Select Individual Designs for Verification



~100,000 genes encoding mini-proteins ~60 aa

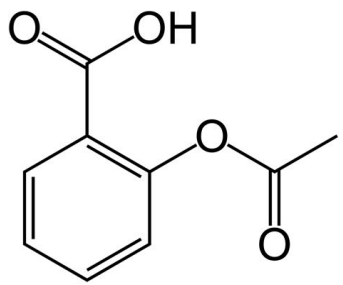
Transform yeast with plasmids encoding minibinder design library, and treat with limited protease and / or heat

Identify gene sequences encoding functional designed minibinders

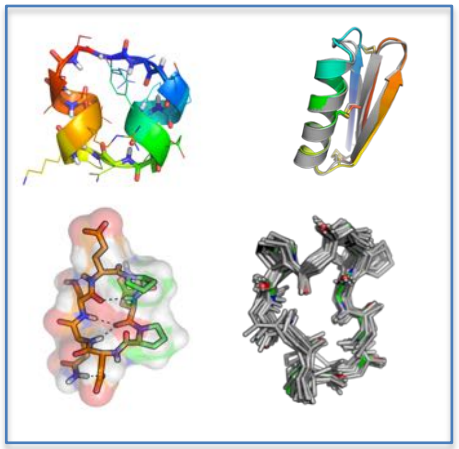
Individual clones expressing designed minibinders are used to verify function

Protein Design Takes Us Beyond Traditional Small Molecules and Antibodies

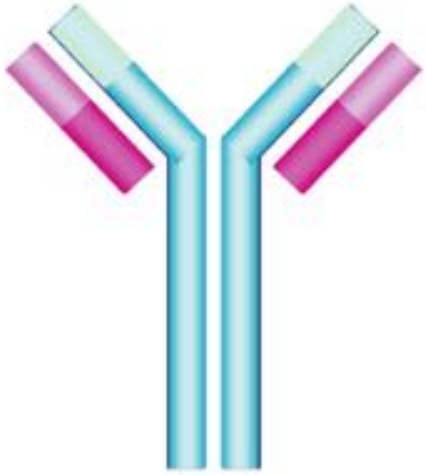
- Computational design enables bottom up creation of totally new functional designer peptides, proteins, and nanomaterials.



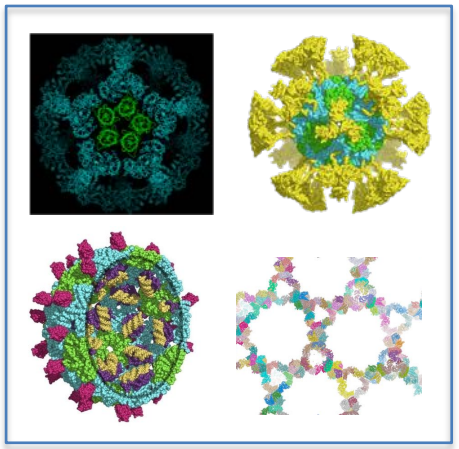
Traditional Small Molecule Drugs <1 KDa.



Computationally Designed Mini-Proteins (<100 aa) Macrocycles (7-16 aa) 1-12 KDa.



Traditional Antibodies or Smaller Ab Fragments 13-160 KDa.



Computationally Designed Smart Nanomaterials 50 KDa. – 3 MDa.

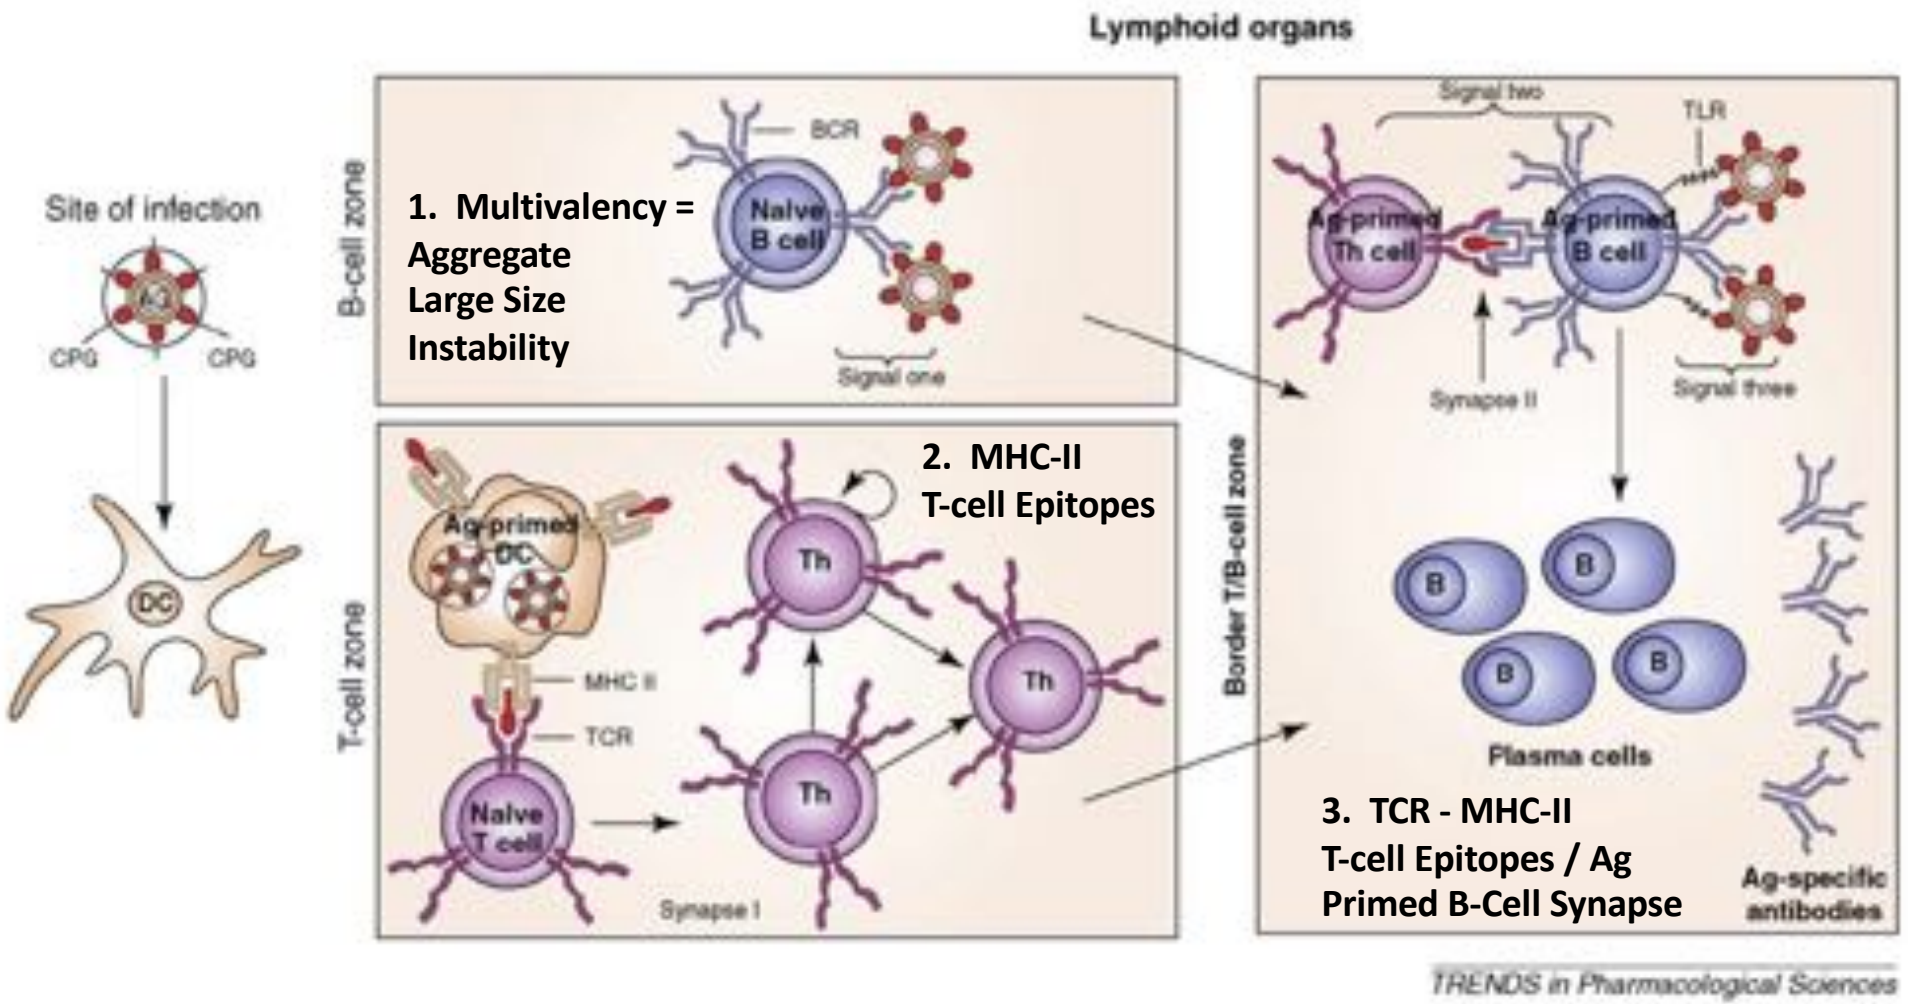
Immunogenicity ?

Causes of Immune Responses to Proteins



Sauerborn M, Brinks V, Jiskoot W, Schellekens H. Immunological mechanism underlying the immune response to recombinant human protein therapeutics. Trends Pharmacol Sci. 2010 Feb;31(2):53-9.

Features of Immunogenic Substances vs. *De Novo* Designed Mini-Binders

Immunogenic Protein	**Designed Mini-Binder / Macrocycle**
Large size (> 10 KDa.)	Small (< 10 KDa.)
Multivalent = B-cell receptor crosslinking	Monomeric
Poor stability = Denaturation = Aggregation = Multivalent	Hyper-Stable (>80 ˚C, Protease resistant)
Not Self	Not Self
T-cell epitopes (MHC-II) require processing and presentation.	Hard to digest or D-handed un-natural amino acids make it hard to process.
Re-design (deimmunize) hard	Re-design (immune silence) easier
Long T1/2 resident time (weeks)	Short T1/2 (minutes to hours)
Delivery is often I.V. or S.C. (systemic)	Delivery options, I.V., S.C., Aerosol (localized)
Excipient formulations	Simple formulations (PBS)

Designed Influenza Therapeutic Mini-Binder

- Low cost potent, inhalable, long-lived, broadly neutralizing anti-viral therapeutic.
- 40 amino acids (synthetic or recombinant)
- 2 disulfide bonds, Tm > 95˚C, Kd > ~5 nM.
- In vitro Neutralization EC50 < 0.003 ug/ml.
- Not immunogenic in mice.

Heat Stable Aerosol

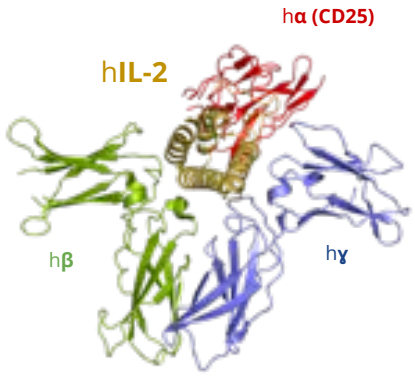
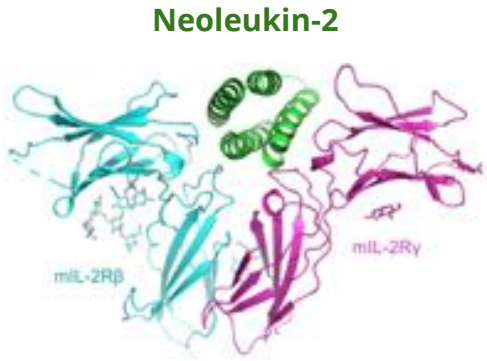
De Novo Designed Interleukin 2 (IL-2) Mimetics

- Less toxic than IL-2
- Easier of manufacture
- Heat stable, 90 aa mini-protein
- Wide range of immune-oncology applications
- No immunogenicity observed in mice.

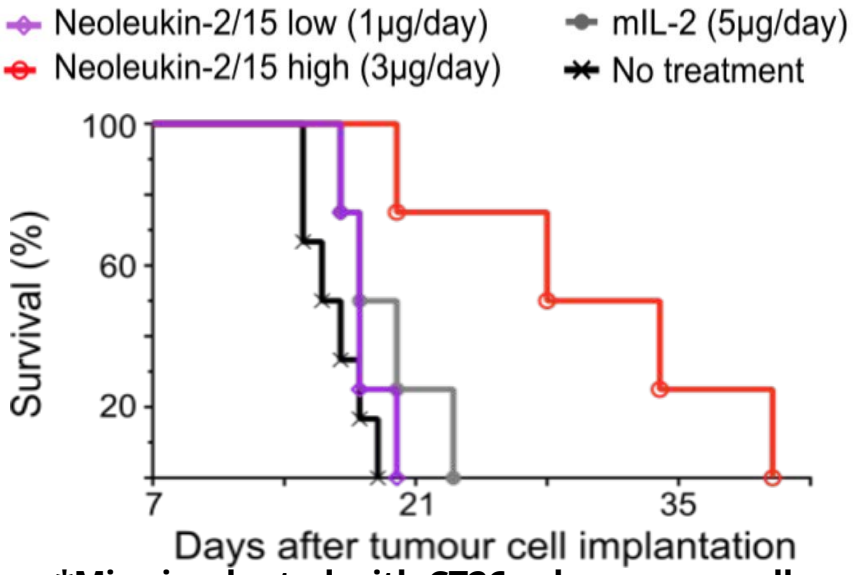
Multi-Dose Monotherapy or Combination Therapy For Challenging Cancers



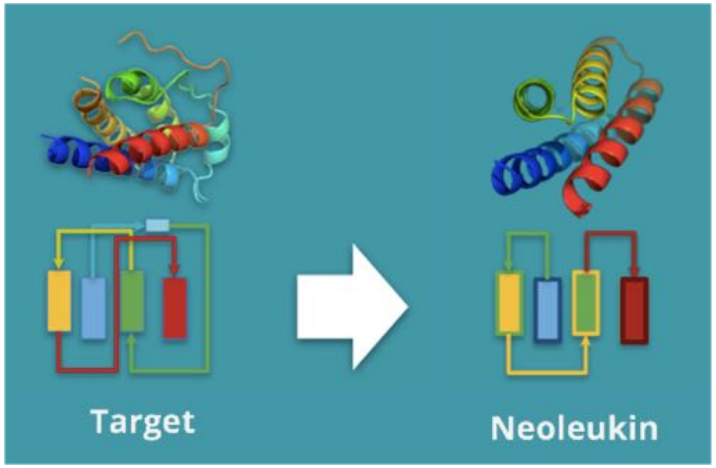
Co-crystal structure of IL-2



Co-crystal structure Neoleukin-2



***Mice implanted with CT26 colon cancer cells.**



Daniel Silva, Umut Ulge, Carl Walkey, Alfredo Quijano Rubio, Baker Lab with Michael Dougan and Chris Garcia

De Novo Designed Interleukin 2 (IL-2) Mimetics Have No Anti-Design Antibody Response

Positive control mouse pAb anti-Neo2/15 raised with adjuvant

Negative control fetal bovine serum

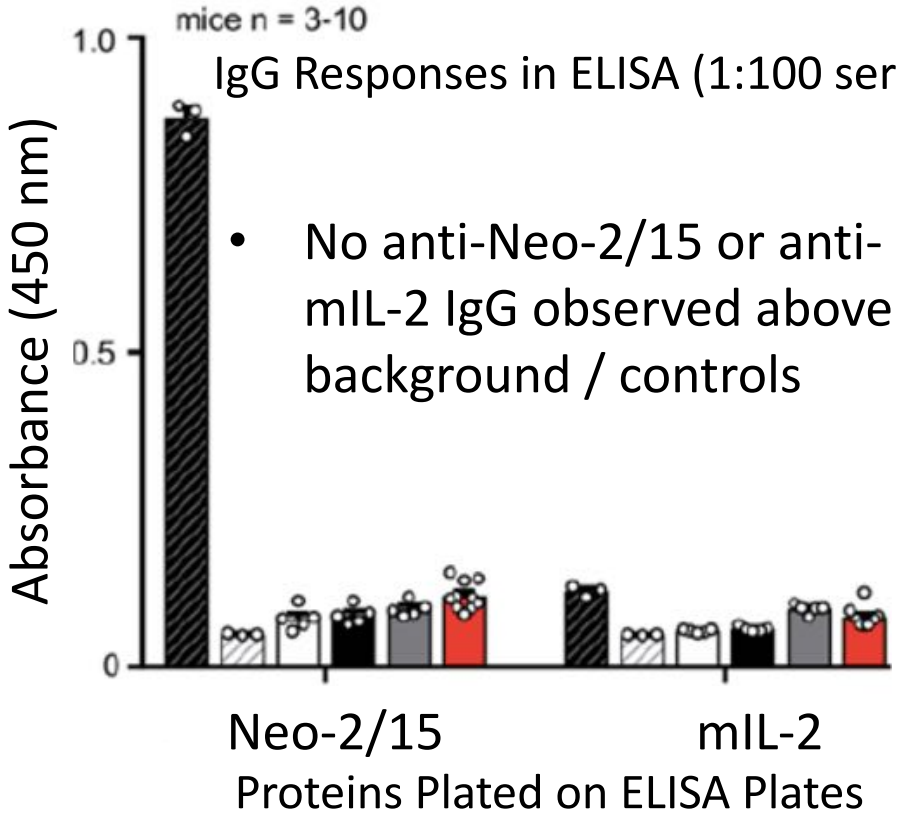
No treatment

K.O. Neo-2/15 unable to bind receptor

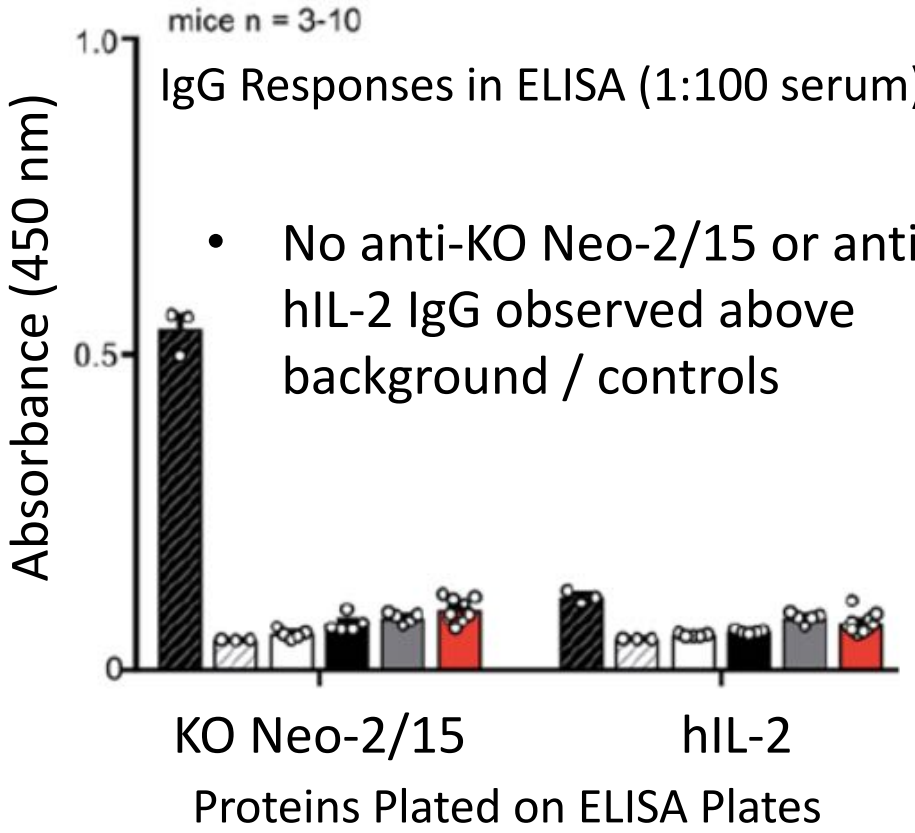
Mouse IL-2 (mIL-2)

Neo-2/15

C57BL/6 mice were dosed daily with 10 ug for 28 days and then serum collected



- No anti-Neo-2/15 or anti-mIL-2 IgG observed above background / controls

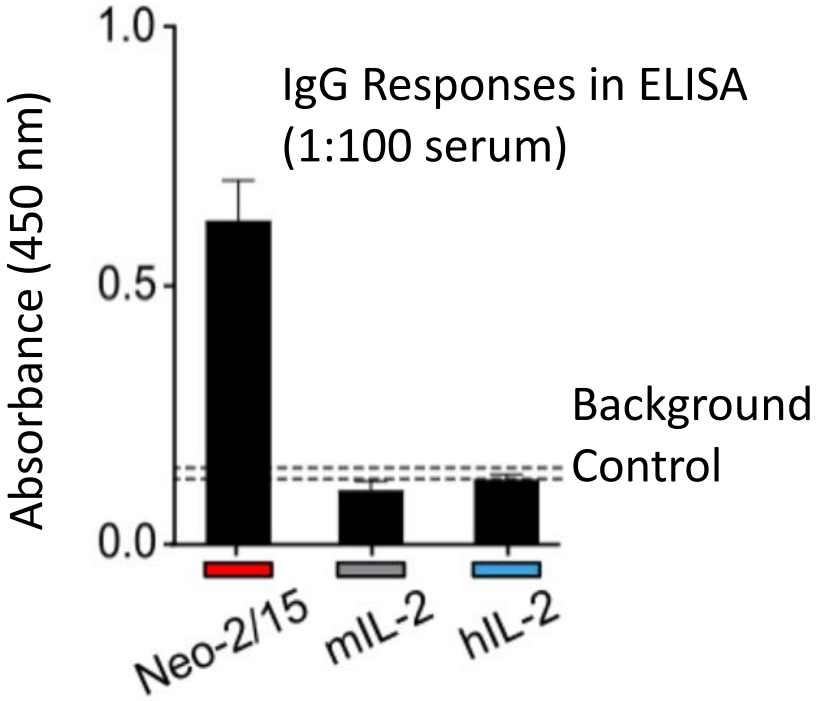


- No anti-KO Neo-2/15 or anti-hIL-2 IgG observed above background / controls

Daniel Silva, Umut Ulge, Carl Walkey, Alfredo Quijano Rubio, Baker Lab with Michael Dougan

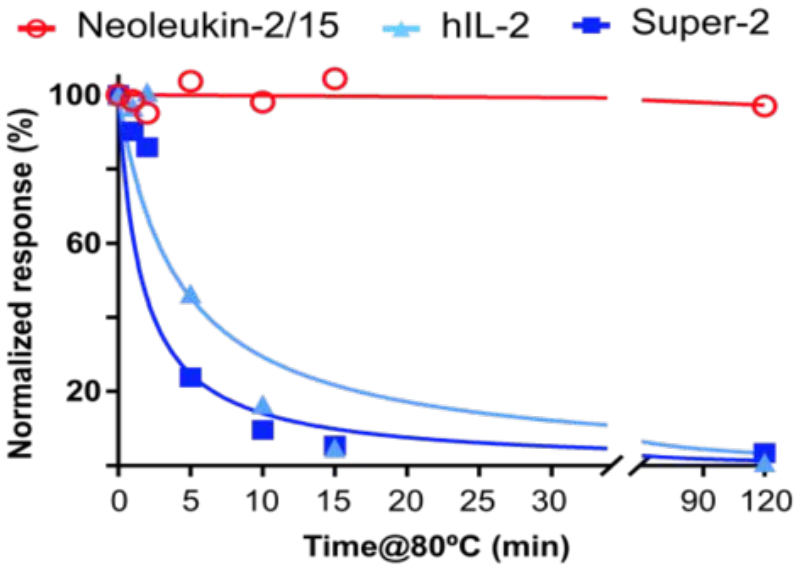
De Novo Designed Interleukin 2 (IL-2) Neo-2/15

Mouse polyclonal anti-Neo-2/15 raised with adjuvant do not react with mouse IL-2 or human IL-2



Proteins Plated on ELISA Plates

Neo-2/15 still binds hIL-2RβX receptor after Incubation @80˚C



Daniel Silva, Umut Ulge, Carl Walkey, Alfredo Quijano Rubio, Baker Lab with Michael Dougan

Structure and Function By Design

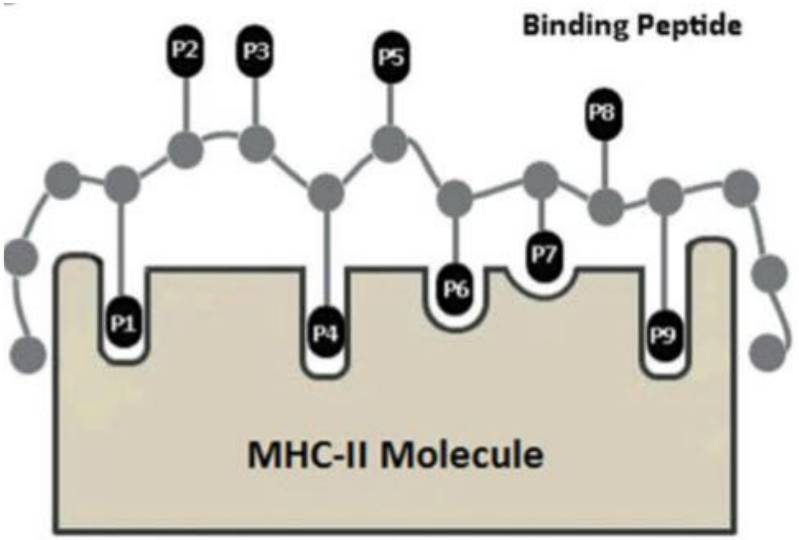
- Through design, we can maintain structural features through design of an astronomical number of different amino acid sequences.

- As such, numerous desired target product profile features are achievable through *de novo* design.
  - Size
  - pI
  - Stability
  - H-bonding networks = hydration sphere
  - Others.

- By definition *de novo* designed protein sequences do not exist in nature and could be recognized as foreign!
- How can we design immune silence ?

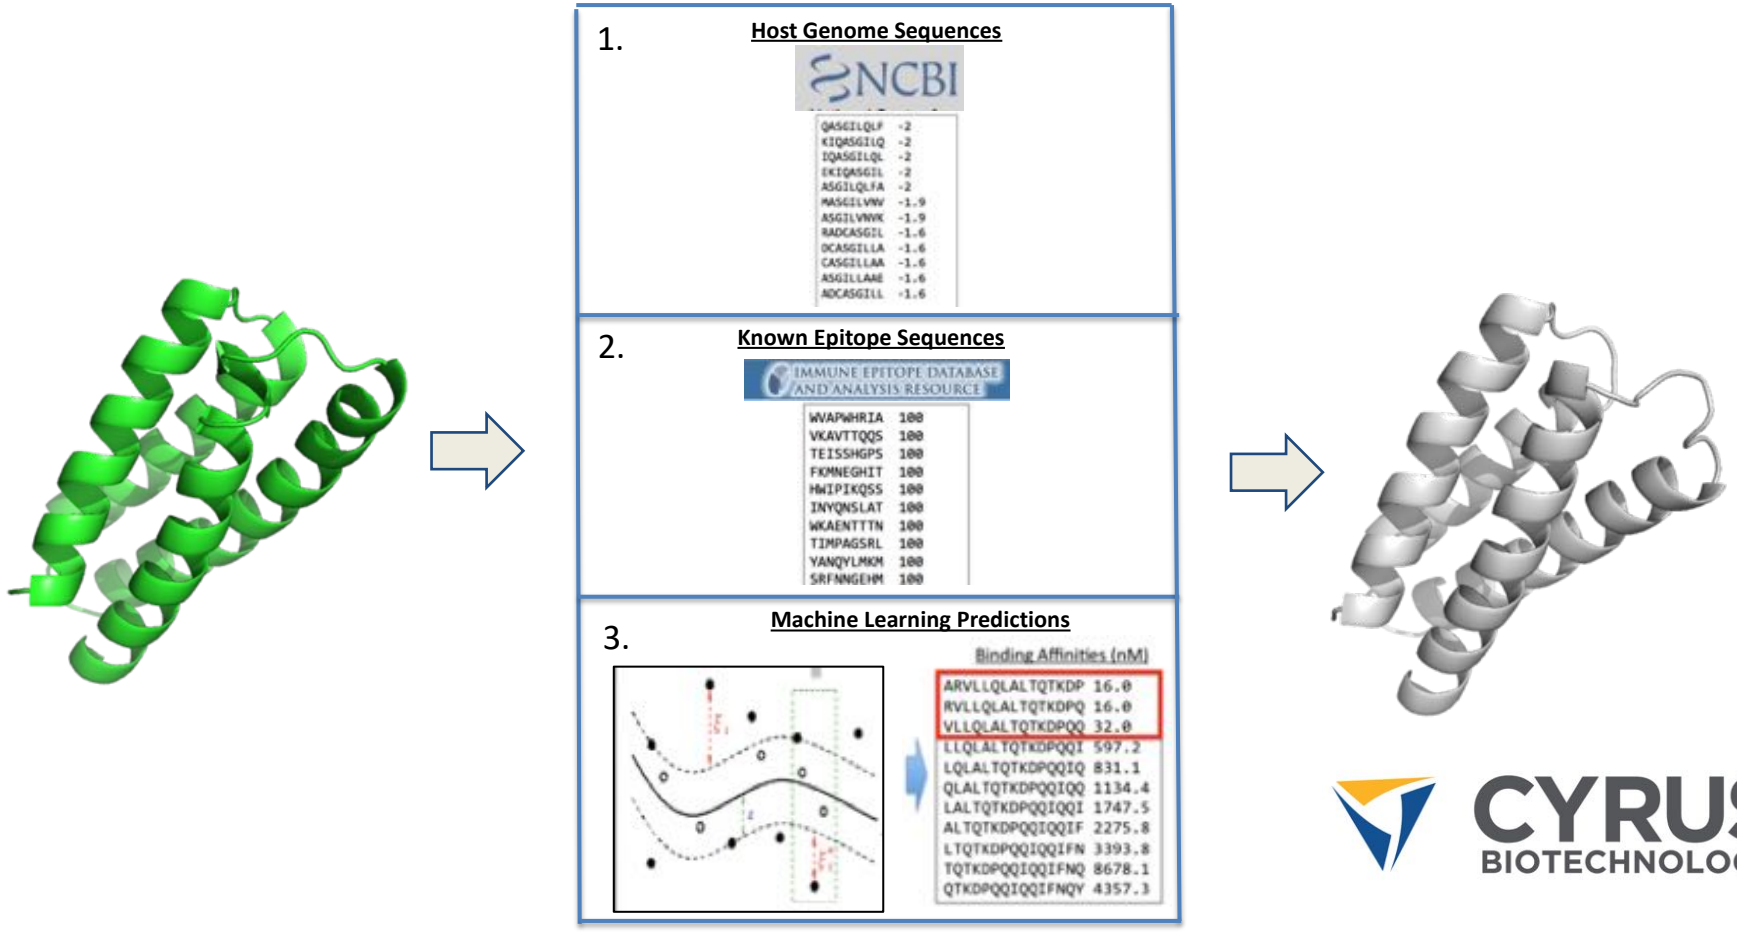
MHC-II displays peptides on the surface of cells for T-cell receptors

- Peptide binding cleft between 2 domains
- **binds 15-24mers, 9mer core**
- P1,P4,P6,P9 “pocket” positions



Reducing the Liability of T-cell Epitopes by Design

- Through Rosetta design, we can maintain structural features and alter the amino acid sequence to “silence” predicted or known offending T-cell epitopes.



King C, Garza EN, Mazor R, Linehan JL, Pastan I, Pepper M, Baker D. Removing T-cell epitopes with computational protein design. Proc Natl Acad Sci U S A. 2014 Jun 10;111(23):8577-82.

Current Immunogenicity Testing Paradigm for *De Novo* Designed Proteins

- **Step 1.** Since MHC-II T-cell help is key to IgM to IgG class switching and strong long lived antibody responses, we scan *de novo* designed sequence through T-cell epitope prediction software (~$10 per protein, in compute time).
- **Step 2.** Any T-cell epitopes identified in Step 1 should be synthesized and tested in Naïve Primary T Cell Assay (e.g. Proimmune) which covers 40 human donors looks at CD4+ T-cell responses (~$5K per peptide = expensive).
- **Step 3.** Any T-cell epitopes of Step 2 that are found to activate CD4+ T-cells should be computationally re-designed (Iterative FlexDesign with position specific score matrix and EpitopeScan Indigo King / Cyrus) while preserving structure and function of original design (~$100 per protein, in compute time).
- **Step 4.** Make and test activity of ~10 new "T-cell epitope silenced" *de novo* designed proteins from Step 3 ($5,000 per design). Downselect the best variant(s).
- **Step 5.** Test a limited number of *de novo* designs from Step 4 in pooled donor DC-cell presentation / T-Cell proliferation assay ($30,000 per design, SUPER EXPENSIVE)
- **Step 6.** Repeat Steps 1-5 as needed. But ultimately need to move a candidate into safety / tox and into the clinic.

Caution: Not All T-cell Epitopes Are “Offensive”

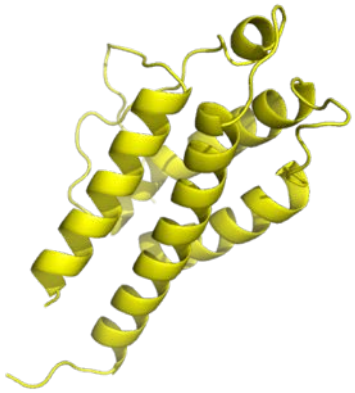
- Most Current Computational Methods only “Identify” T-cell Epitopes
- Native human IL-2 has quite a few ”predicted” MHC-II T-cell Epitopes

Epitope Scan 9

Unit: nM | % Cutoff (%): 10

Structure (Collection)	Number of epitopes in top 10% per allele
5utz_A_IL2_relax_0001_AR_Full-ce7564 (5utz_A_IL2_relax_0001_AR_Full)	560

560 Predicted T-Cell Epitopes in human IL-2



PDBID: 5utz

Presumably central tolerance is dealing with these epitopes

Considering Anti-Drug Antibodies (ADAs) Observed for Approved Biologics vs. *De Novo* Designs

- Most approved / licensed biologics are known to elicit ADAs (Stats)
- Most of these ADA's have no effect on PK / PD of biologic therapy
- Sometimes there is a dangerous auto-immune reaction (e.g. Factor VII) / Rare

- Conclusions:
  - Approved biologics aren't necessarily a good proxy for *de novo* designed proteins
  - Of the approved biologics, it is primarily the foreign (not mAb, not human protein) that are known to elicit ADAs.
  - *De novo* designed mini-proteins tend to be immune silent due to their stability, small size, monomeric nature, short serum half-life.
  - *De novo* designed mini-proteins can be re-designed to reduce the liability of offensive T-cell epitopes.
  - Since *de novo* designed proteins are foreign, but do not have sequence similarity to human proteins it is unlikely an ADA immune response would have an adverse effect (needs to be tested).
