

Regulatory Standards for the Safety and Efficacy of Wearable Medical Technologies

Team Never Generic

Thomas Adriaens, Kira Aldrich, Uyen Nguyen, Khang Nong, Mary Zhang

Wearables in the Healthcare Landscape

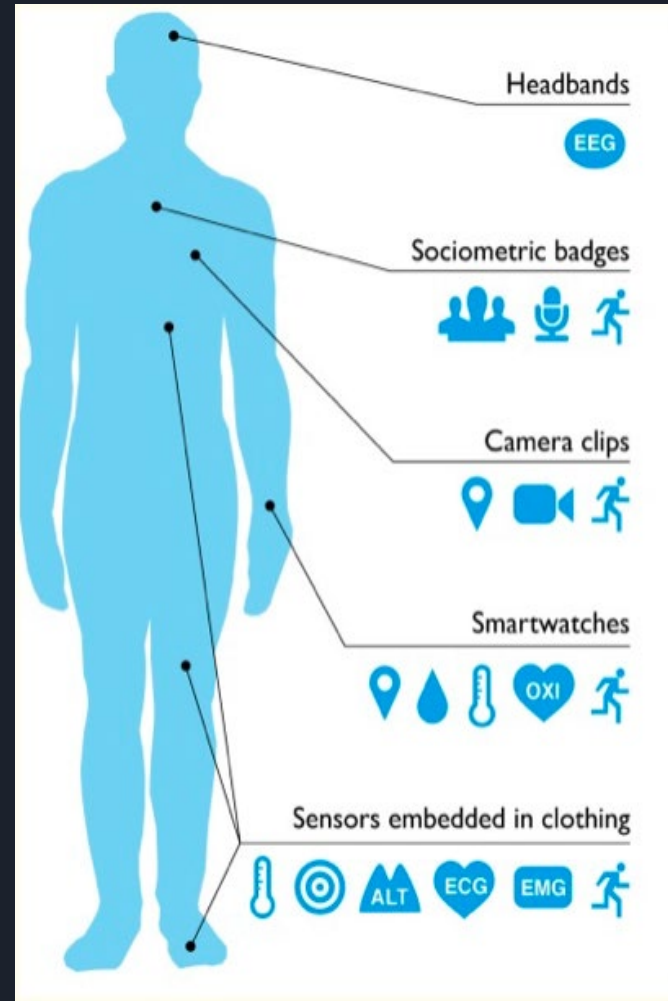

Trend shifting towards patients independently managing their own health using consumer products.

Wearables in the Healthcare Landscape

Role in patients with chronic conditions

- “Predictive preventative diagnosis”
- User-safety gray area
 - False sense of security
 - Over-reliance & misdiagnosis
- Lack of standardized reliability and validity
 - Stanford HEART Trial (Apple)
 - JAMA Dermatology Review

Researchers urge caution on wearable health devices

Date: February 3, 2016

Source: Lancaster University

Summary: Wearable devices to monitor health are not always reliable or secure according to re-

ults expected to ch next year

egment growth, thanks to new

Definitions

“Wearable medical technologies”

Externally worn and portable devices that operate on software connected to sensor systems intended to measure and track health data.

Devices in Development

Examples:

Apple Watch APIs

FitBit

Smartwatch SmartMonitor

Samsung Galaxy Gear Watch

Device Classifications

Class	Definition	Examples
1	No to mild risk to patient	Thermometers, bedpans, stethoscopes
2	Moderate to high risk to patient	Powered wheelchairs, Apple Watch Series 4, pregnancy test kits
3	High risk to patient	Pacemakers, breast implants

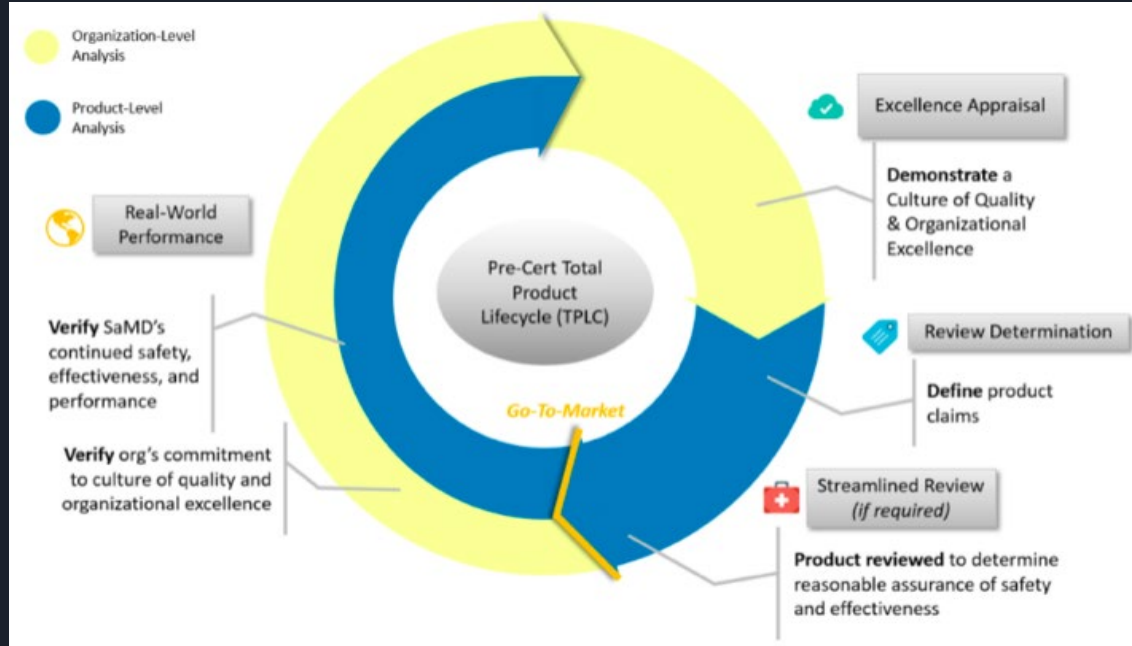

De Novo and 510(K)

De Novo - Classification process for new medical devices to get approved using risk based strategy.

510(K) Pathway- Approval process for medical devices that are substantially equivalent to an approved device already on the market.

The “Pre -Cert” Program

- Digital Health Software Pre-certification Program (“Pre-Cert”)

- SaMD - “Software intended to be used for medical purposes that perform these purposes without being part of a hardware medical device”

Our Proposal

A recommendation and proposal for guidelines addressing the emergence of health-based technologies regarding issues surrounding safety and efficacy

Recommendation 1

After De Novo is granted, an FDA verification mark shall be given to a Class 2 medical device provided it meets high-quality clinical standards based on sufficient clinical trial data demonstrating accuracy and precision in results.

- Patient assurance
- Company incentive
- Digital Health Software Precertification Program

Recommendation 2

False positives and negatives from class II wearable devices with diagnostic and monitoring implications shall be reported to the Manufacturer and User Facility Device Experience (MAUDE) database by patients, healthcare providers, or the manufacturer.

- Manufacturer improvement
- FDA investigation for false-negatives and malfunctions causing significant patient harm.

Recommendation 3

Alongside a formally written privacy statement, it is recommended that the medical device manufacturer should have a user-friendly informed consent tutorial to be included in the interface of the medical device or another supported device

- The FDA can incentivize it by using the verification mark per Recommendation 1.

Closing Remarks

With these recommendations, we hope that the FDA can be prepared for the imminent release of many wearable medical technologies in the future.

**Patient
Perspective**

Innovation

Advancement

Thank You!
